The sequence tag present in the cDNA between the Notl site and the oligo-dr track served to identify it as a clone from the normalized oliactory bubbs library CDNA Library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP CDNA clones will be made available by the means that is soon to be determined. When NIH determines the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined. Seg primer: M13 Forward

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 1. | 17.00.20, 20.00.20, 20.00.20, 20.00.20, 20.00.20, 20.00.20, 20.00.20, 20.00.20, 20.00.20, 20.00.20, 20.00.20, 20.00.20, 20.00.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.00.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20.20, 20

                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that of a consensus BS124-specific EST clone. It is useful for detecting, diagnosing, staging, preventing or treating, or determining predisposition to diseases or conditions of the breast, such as breast cancer.
                                                                                                                                                                                                                                                                                                                                      New isolated BS124 polynucleotides and polypeptides - used detecting, diagnosing, preventing or treating diseases or of the breast, such as breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 692 BP; 162 A; 209 C; 205 G; 116 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a breast specific gene (BSG) clone. The BSG sequences are also referred to as breast specific markers (BSM). The invention relates to methods for diagnosing, monitoring, staging, inaging and treating breast cancer (BC). The methods comprise measuring the levels of BSG products in cells, tissues or body fluids of the patient and comparing the measured levels of BSG, with BSG levels of a normal human control. An antibody against the BSG sequences can be labelled and used for imaging BC in a patient. The antibody can be conjugated to a cytotoxic agent, and used for treating BC in a patient.

                                                                                                             Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene therapy -
                                   Fong S;
Hillan KJ;
                                                                                                                                                                                         The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240

                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO anti-Dodies, agonists and antagonists are useful for proteins, anti-PRO anti-Dodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic tapper sythematosus, rhematoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sigoren's syndrome, systemic vasculitis, sarcoidosis, autoimmune hemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyellaring diseases of the central and peripheral nervous systems, hepatobilizary diseases, inflammatory concelluseses, inflammatory autoimmune or immune-mediated skin diseases, allergic disease, autoimmune or immune-mediated skin diseases, allergic disease, autoimmune or immune-mediated skin diseases, allergic diseases, autoiming graft rejection and graft-versus host-disease. AMCSB397 to AACSB397 to AACSB397 to AACSB397 to AACSB397 to AACSB57 and AARSB3414 to AARSB3477 represent human PRO polymucleotide and protein sequences given in the sexemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primars and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New mammalian DNA sequences encoding transmembrane, receptor or secreted PNO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand inheractions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Wood WI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or dispnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, mycoardial infarctions, thromophlebitis, lymphangitis, tumour anglogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 TGGGTGTCACGCTCGGCCTGGCCTGCTCCTTCACCCTGGAGGAGGAGGATATCA 120

ABB18072 to ABIB8258 encode the PRO proteins given in ABB84817 to
ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic,
antinanjongenic, hypotensive, vulneary and antiarteriosclerotic
activities, and can be used in gene therapy. The PRO polynucleotides,
activities, and can be used in gene therapy. The PRO polynucleotides,
cardiovascular, endothelial or angiogenic disorder in a mammal,
e.g. cardiac hypertrophy, trauma, cancer, age-related macular
ce.g. cardiac hypertrophy, trauma, cancer, age-related macular
ce.g. cardiac hypertrophy, trauma, cancer, age-related macular
ce.g. cardiac hypertrophy, mycordial infarctions, thromophlebits,
lymphangitis, tumour angiogenesis (such as breast carcinoma and liver
carcinoma) and wound healing. The PRO polynucleotides have applications
corrictional biology, including use as hybridisation probes, and in
chromosome and gene mapping. ABIR88259 to ABI88267 represent primers and
probes used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Baker KP, Ferrara N, Gerber B, Gerritsen ME, Goddard A;

The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPID-alpha. OBPs provide long-term retention (gradual capace) of lipophilic compounds, so proflong the 'hold' of perfumes, declarasts etc. OBP polypeptides are used as binding proteins for hydrophobic ligands (particularly odorants); as competitive inhibitors (aponists or antibodiss) of cabillar librocation receptors; to detect specific artibodies for diagnosis of alleray, astuma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, controlling upperlipidemia or obesity, or to supplement non-maternal milk when combined with untritional fatty acids, as food additives; as a transporter of pharmaceuticals, especially anticancer agents (providing delayed release) but also for delivery across the placental barrier (e.g. for deroxification of the foetus); as a marker of pregnancy or cete. The particular of the foetus); as a marker of pregnancy or cete.
                        New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             183 AGGAAGGTGTCCCCAGTGAAGGTGACAGCCCTGGGCGGGGGGAAGTTGGAAGCCACGTTC 242

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPITA-alpha. OBPS provide Long-team retention (gradual) crelease) of lipophilic compounds, so prolong the 'hold' of perfumes, decodorants etc. OBP polypeptides are used as binding proteins for thydrophobic liquads (particularly odorants); as competitive inhibitors (agonists or antagonists) of cellular lipocalcin receptors; to detect the specific authodies for diagnosis of allergy, asthma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, commercies or disinfectant compositions; to screen compounds, especially controlling volatilisation of an odorant, specifically in perfumes, commercies or flavours, e.g. human pheromones, for binding to OBP, also in analysis of complex perfume mixtures; to solubilise lipophilic compounds; or treating hyperlipidemia or obesity, or to supplement nor maternal milk when combined with nutritional fatty acids, as food additives; as a transporter of pharmaceuticals, especially anticancer agents (providing Cellayed Lelases) but also for delivery across the placental particle of the foctus; as a marker of pregnancy or controlly pathology (rupture of the amniotic membrane); and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma; cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human odozant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPITa-beta. OBPS provide long-term retention (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc. OBP polypeptides are used as binding proteins for hydrophobic lipomas, so prolong the 'hold' of perfumes, appoints or antagonists) of cellular libocalcur receptors; to detect specific antibodies for diagnosis of allergy, asthma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, compacting the compactions of allergy, asthma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, controlling volatilisation of an odorant, specifically in perfumes, controlling pyperlipidemia or obesity, or to supplement non-maternal for treating hyperlipidemia or obesity, or to supplement non-maternal milk when compined with nutritional fatty acids, as food additives; as a transporter of pharmacenticals, especially anticance agents (providing teg. of detoxification of the foetus); as a marker of pregnancy or controlling and as a serial partier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              63 GETGTCACGCTCGGCCTGGCCGCTGTCCTTCACCCTGGAGGAGGAGGATATCACA 122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 GETGICACGETGGCCEGGCGCTGCCCTGTAGAGAGAGAGAGATATCACA 120

release) of lipophilic compounds, so prolong the 'hold' of perfumes, and dedocrants etc.. OBP polypeptides are used as binding proteins for phychophobic liquads (particularly docrants); as competitive inhibitors (agonists or antagonists) of cellular lipocalcin receptors; to detect to specific antibodies for diagnosis of allergy, asthma or canner; for controlling volatilisation of an odorant, specifically in perfumes, cosmetics or disinfectant compositions; to screen compounds, especially odorants or flavours, e.g. human pheromones, for binding to OBP, also in analysis of complex perfume mixtures; to solubilise lipophilic compounds; or treating hyperlipidemia or obesity, or to supplement non-maternal milk when combined with nutritional fatty acids, as food additives; as transporter of pharmaceuticals, especially anticancer agents (providing dalyed release) but also for delivery across the placental partier (e.g. for detoxification of the foetus); as a marker of pregnancy or setting incomplemental partier of pharmaceuticals, especially anticancer agents (providing delivery across the placental barrier of percental partier.

The invention relates to isolated polynuclectide (I) and properiod (II) as useful as hybridisation probes, polyneciase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The complex consists are saylenessed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in madical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. (I) and of the polypectide and polynuclectide sequences have applications in disorders involving aberrant protein expression or biological activity. (I) and of the involving partners are useful in medical disorders involving aberrant protein expression or biological activity. (I) and conduce other types of deat and products dependent on INN and amino acid sequences. Ask6197-Ask94564 represent novel human conductions appeared to the involvention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             patent did not appear in the printed in electronic format directly from WIPO

The present sequence encodes a human odorant binding polypeptide (OBP), assignated OBPILP-beta (long form). OBPs provide long-term retention of gradual release) of lipophilo compounds, so prolong the 'hold' of cardual release) of lipophilo compounds, so prolong the 'hold' of perfumes, deodorants etc.. OBP polypeptides are used as binding proteins to rhydropholo lipands (particularly adorants), as competitive activities of entragonists) of cellular lipocalcin receptors; inhibitors (agonists or antiagonists) of cellular lipocalcin receptors; inhibitors (agonists or antiagonists) of cellular lipocalcin receptors; for controlling volatilisation of an odorant, specifically in perfumes, comments or flavours, e.g. human pheromomes, for binding to OBP, also in analysis of complex perfume mixtures; to solubilise lipophilic compounds; or treating hyperlipidemia or obesity, or to supplement non-maternal milk when combined with nutritional fatty actios, as food additives; as a transporter of pharmaceuticals, especially anticancer agents (providing transporter or late of or delivery across the placental barrier or cellular late of or delivery across the placental barrier or feet, placental pathology (rupture of the amniotic membrane); and as
                                                                                                                  New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      301 CCTGGCAAATACAGCGCCTGCTTGTCCGCAGTCGAGATGGACCAGATCACGCCTGCCCTC 350

                                                                                                                                                                                                                                                 ğ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypepitides (AAK7833-AAK80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypepitides are useful in gene therapy, vaccines or pepitide therapy. The polypepitides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating
